

Modular Program Report

The following report(s) provides findings from an FDA-initiated query using its Mini-Sentinel pilot. While Mini-Sentinel queries may be undertaken to assess potential medical product safety risks, they may also be initiated for various other reasons. Some examples include determining a rate or count of an identified health outcome of interest, examining medical product use, exploring the feasibility of future, more detailed analyses within Mini-Sentinel, and seeking to better understand the capabilities of the Mini-Sentinel pilot.

Data obtained through Mini-Sentinel are intended to complement other types of evidence such as preclinical studies, clinical trials, postmarket studies, and adverse event reports, all of which are used by FDA to inform regulatory decisions regarding medical product safety. The information contained in this report is provided as part of FDA's commitment to place knowledge acquired from the Mini-Sentinel pilot in the public domain as soon as possible. Any public health actions taken by FDA regarding products involved in Mini-Sentinel queries will continue to be communicated through existing channels.

FDA wants to emphasize that the fact that FDA has initiated a query involving a medical product and is reporting findings related to that query does not mean that FDA is suggesting health care practitioners should change their prescribing practices for the medical product or that patients taking the medical product should stop using it. Patients who have questions about the use of an identified medical product should contact their health care practitioners.

Modular Program Type: MP 3 - Drug Use – Incident Outcomes

(See online specification for details:

http://mini-sentinel.org/data_activities/modular_programs/details.aspx?ID=111)

Date Posted: January 17, 2012

Medical product exposures of interest:

This Modular Program execution included 4 different exposure categories. Each exposure category was assessed independently.

- Varenicline – all NDCs (identified with FirstDataBank)
- Bupropion
 - All NDCs (identified with FirstDataBank)
 - NDCs classified as “smoking cessation” by FirstDataBank Enhanced Therapeutic Classification (ETC) hierarchy
 - NDCs classified as “antidepressant” by ETC hierarchy

Exposure time at risk:

The new user and days of exposure specifications for each exposure category are as follows:

- The first dispensing after at least 180 days of no exposure to any of the drugs of interest (i.e., new or incident users) was identified between January 1, 2006 and the most recently quality checked data at each Data Partner as of July 5, 2011. The end date across Data

Partners ranged from the end of 2009 to 1st quarter of 2011. A treatment episode was created using the number of days supplied on each consecutive dispensing; gaps of 7 days or less between dispensings were bridged, and 7 days of exposure were added to the end of the last dispensing

- Exposed time at risk began on the day after the first incident dispensing and continued for the entire treatment episode (or end of enrollment or occurrence of an outcome)

New user inclusion/exclusion criteria and cohort definitions:

New users for each drug of interest were further restricted by eligibility and diagnosis exclusion criteria. Separate analyses were run for 3 different new user cohorts.

- Eligibility requirements – Individuals who met the following criteria were included:
 - Continuously enrolled with both medical and drug coverage for at least 180 day before the index date (date of first incident dispensing)
 - At least 20 years or older at the time of first dispensing of varenicline or bupropion
 - Free of any dispensing of any of the drugs of interest in the 180 days before the index date
- Exclusions - Individuals with any of the following codes during the 180 days before the initial dispensing were excluded:
 - Acute myocardial infarction (ICD-9-CM 410.xx)
 - Intermediate coronary syndrome or unstable angina (ICD-9-CM 411.1)
 - Acute coronary occlusion without myocardial infarction (ICD-9-CM 411.81)
 - Coronary atherosclerosis (ICD-9-CM 414.0x)
- New user cohorts – individuals who met the inclusion/exclusion criteria were grouped into the following 3 cohorts to allow for 3 independent assessments:
 - All new users
 - Tobacco cohort: limited to individuals with a diagnosis of nondependent tobacco use disorder (ICD-9-CM Code 305.1) during the 180 days before the index date
 - Depression cohort: limited to individuals with a diagnosis of depression (ICD-9-CM Codes 296.2, 296.3, 300.4, 311) during the 180 days before the index date

Outcome of interest definition:

The outcome of interest was identified during exposure time at risk. The composite outcome was defined as any of the following diagnoses flagged as the primary diagnosis observed in the inpatient or emergency department settings during exposure time at risk:

- Acute myocardial infarction (ICD-9-CM 410.xx)
- Intermediate coronary syndrome or unstable angina (ICD-9-CM 411.1)
- Acute coronary occlusion without myocardial infarction (ICD-9-CM 411.81)

Results:

The results are shown in the following tables and figures.

^aFour different exposure groups were examined in this analysis: (1) Varenicline includes individuals who initiated use of varenicline; (2) Bupropion for Any Reason includes individuals who initiated use of bupropion for any reason; (3) Bupropion for Smoking Cessation: Individuals who initiated use of bupropion for smoking cessation (national drug code listed as “smoking cessation” as defined by First DataBank’s Enhanced Therapeutic Classification); (4) Bupropion for Treatment of Depression includes individuals who initiated use of bupropion as an anti-depressant (national drug code listed as “antidepressant” as defined by First DataBank’s Enhanced Therapeutic Classification).

^bThree different cohorts of users were examined in this analysis: (1) the overall Cohort includes all new users of drug product group of interest without respect to pre-existing conditions; (2) the Tobacco Cohort includes new users of drug product of interest with a prior diagnosis of nondependent tobacco use disorder (ICD-9-CM Code 305.1) in the 180 days before drug product initiation; (3) the Depression Cohort includes new users of drug product of interest with a prior diagnosis of depression (ICD-9-CM Codes 296.2, 296.3, 300.4, 311) in the 180 days before drug product initiation.

^aFour different exposure groups were examined in this analysis: (1) Varenicline includes individuals who initiated use of varenicline; (2) Bupropion for Any Reason includes individuals who initiated use of bupropion for any reason; (3) Bupropion for Smoking Cessation: Individuals who initiated use of bupropion for smoking cessation (national drug code listed as “smoking cessation” as defined by First DataBank’s Enhanced Therapeutic Classification); (4) Bupropion for Treatment of Depression includes individuals who initiated use of bupropion as an anti-depressant (national drug code listed as “antidepressant” as defined by First DataBank’s Enhanced Therapeutic Classification).

^bThree different cohorts of users were examined in this analysis: (1) the overall Cohort includes all new users of drug product group of interest without respect to pre-existing conditions; (2) the Tobacco Cohort includes new users of drug product of interest with a prior diagnosis of nondependent tobacco use disorder (ICD-9-CM Code 305.1) in the 180 days before drug product initiation; (3) the Depression Cohort includes new users of drug product of interest with a prior diagnosis of depression (ICD-9-CM Codes 296.2, 296.3, 300.4, 311) in the 180 days before drug product initiation.
