FDA-Catalyst: IMPACT-AFib randomized trial

Implementation of a randomized controlled trial to improve treatment with oral Anticoagulants in patients with Atrial Fibrillation

- Direct mailer to health plan members with AFib, high risk for stroke, and no oral anticoagulant (OAC) treatment, and their providers to encourage consideration of OACs
IMPACT-Afib Participating Sites

- Aetna
- Optum
- HealthCore
- Anthem
- Harvard Pilgrim
- HUMANA
- Massachusetts General Hospital
- Vanderbilt School of Medicine
- HCA
- Kaiser Permanente
Atrial fibrillation, a common and important problem

- 2.7–6.1 million people in the U.S. have atrial fibrillation (AFib)
- 4-5 fold increase in risk of stroke
  - 750,000 added strokes per year in U.S.
  - Contributes to 130,000 deaths
- ~2/3 of AFib related stroke is preventable with oral anticoagulants (OACs)
- 40-60% of AFib patients at risk of stroke are not on OAC therapy

Objective

To estimate the number of health plan members with AFib at risk for stroke without evidence of OAC use
Trial cohort eligibility

- Adult ≥30 years old
  - Medical & pharmacy coverage for ≥365 days
- ≥2 AFib diagnosis codes
- No OAC dispensing (or ≥4 INR measurements) within the last year
- High risk for stroke (CHA2DS2-VASc score ≥2)
- Exclusions:
  - History of mechanical prosthetic valve, deep vein thrombosis, pulmonary embolism, intracranial bleed
  - Hospitalized bleed in last 6 months
  - Current pregnancy
  - Current P2Y12 inhibitor treatment, e.g., clopidogrel

**TOTAL**
- Follow-up period: 365 days after 2013 diagnosis or until an event or disenrollment

- Event definitions:
  - Anticoagulant treatment (≥1 NDC or ≥2 INR CPT codes)
  - TIA or stroke (≥1 ICD-9-CM code in any care setting)
  - Bleeding (≥1 ICD-9-CM code in any care setting)
Timeline

Feb 9: Began feasibility query development

Mar 3: Finalized specifications

Apr 4: Reports assembled, shared with Workgroup

February 2016          March 2016          April 2016
Results from five Data Partners

- **44,786** individuals identified with AF with no evidence of current or recent OAC use
- **38,759** (87%) eligible for anticoagulant treatment

Among those, by end of follow up:

- 12,867 (33%) had evidence of anticoagulant dispensing
- 5,917 (15%) had a documented TIA or stroke
- 3,469 (9%) had a documented bleeding event
Proportion of AFib members at five Data Partners with an event at end of follow up

- **OAC initiation**
  - CHA2DS2-VASc score ≥2 (N=38,759)
  - CHA2DS2-VASc score <2 (N=6,027)

- **TIA or stroke**
  - 15%
  - 2%

- **Bleeding event**
  - 9%
  - 3%
Conclusions

- Identified a large number of health plans members potentially eligible for IMPACT-AFib
- Confirmed public health importance
- Demonstrated capability (and speed!) of Sentinel infrastructure to support assessment of trial feasibility

Limitations
- Crude estimates due to analytic limitations of tool
- Misclassification associated with claims data
Where are we now?
IMPACT-AFib

Patient Information

You may have atrial fibrillation and may be at risk of a stroke.

Taking an anticoagulant medication may prevent a stroke.

Atrial fibrillation (AFib) is a heart rhythm disorder. If you have AFib, your blood can pool, which increases the risk of a blood clot forming in your heart. The blood clot can travel to your brain, causing a stroke.

Anticoagulant medications, also called blood thinners, can prevent most strokes in patients with AFib. If you are not taking an anticoagulant medication, you may suffer a stroke that could have been prevented.

People who have the heartbeat irregularity known as “atrial fibrillation” are at an increased risk of having a stroke.

Please visit IMPACT-AFib.org to learn more about atrial fibrillation, stroke risk, and anticoagulant medications. More information about the IMPACT-AFib initiative is available by calling XXX-XXX-XXXX or emailing contact@IMPACT-AFib.org

If you have questions about your benefits, call the number on the back of your health plan ID card.

Talk to your doctor about anticoagulant medications.

This packet contains information about the benefits of taking anticoagulant medications, also called blood thinners, to lower your risk of having a stroke. We recommend that you bring this information packet to your next doctor's appointment. We sent similar information to your doctor.

Anticoagulant medications may not be right for all patients, but they might be right for you. Even if you have talked about this with your doctor in the past, we encourage you to have another conversation about these medications. New anticoagulant medications are safe and effective options for many patients.

Protecting your health information

We take protecting your health information seriously. None of your health information has been shared with other healthcare organizations. Only you and your doctor were sent this information.

Sincerely,

Chief Medical Officer

Enclosures

If you have any questions, please contact [name] at [phone #] or [email].

How do I know if I’m at a high risk for stroke?

If you have AFib, you are at a higher risk of stroke. You are at additional risk if you:

- Have high blood pressure
- Have high blood sugar
- Have a weak heart function
- Have had a stroke or mini-stroke
- Have had a heart attack or blocked vessel in your leg
- Are over 64 years old
- Are a woman

I have AFib only sometimes. Am I still at risk for a stroke?

Yes, the risk is similar whether your AFib is all the time, often, or only occasionally.

What is an anticoagulant?

Anticoagulants are medications that:
- Prevent blood clots
- Keep existing clots from moving

Examples include: Coumadin®, Eliquis®, Pradaxa®, Savaysa®, warfarin, and Xarelto®.

For more information, please visit IMPACT-AFib.org

IMPACT-AFib

Dear Doctor,

As you know, patients who have atrial fibrillation and a CHA2DS2-VASC score of 2 or more are at risk of a stroke and would likely benefit from taking an anticoagulant medication. The CHA2DS2-VASC calculator shows a patient’s risk of a stroke. The score helps determine whether a patient would benefit from an anticoagulant.

The CHA2DS2-VASC calculator calculates a patient’s risk of a stroke. The score helps determine whether a patient would benefit from an anticoagulant.

CHA2DS2-VASC CALCULATOR

Risk factor
- Congestive Heart Failure
- High Blood Pressure
- Hypertension, including normal blood pressure on blood pressure medications
- Age 75 years old or older
- Diabetes
- Stroke or TIA (mini-stroke)
- Vascular Disease (prior bypass surgery, heart attack peripheral artery disease, or aortic plaque)
- Age 65-74 years
- Sex Category: Female sex

TOTAL

Patients with a score of 2 or greater are at high risk for stroke. Strokes may be prevented with an anticoagulant medication.

For additional information, please visit IMPACT-AFib.org.

*The information in this booklet is NOT sponsored by any drug company.

For more information, please visit IMPACT-AFib.org.

IMPACT-AFib

Dear Patient,

Talk with your doctor to find out if taking an anticoagulant medication is right for you. Anticoagulant medications prevent blood clots and are sometimes called blood thinners.

Not sure where to start? Here is a way to start the conversation with your doctor:

1. You received this letter, information sheet, and card in the mail from your health plan. My health plan suggests that I talk with my physician about taking an anticoagulant to help prevent a stroke.

2. Do I have atrial fibrillation?
3. Are my risk factors for stroke?
4. Based on my CHA2DS2-VASC score from the other side of this card, should I be taking an anticoagulant medication?
5. If so, why not?
6. If yes, what kind of anticoagulant would work best for me?
7. Should I be concerned with bleeding if I take an anticoagulant?

Most anticoagulant medications are covered by your health plan. Check with your health plan’s information or call the phone number on your health plan card to determine which of the following drugs are covered: Coumadin®, Eliquis®, Pradaxa®, Savaysa®, warfarin, and Xarelto®.

For additional information, please visit IMPACT-AFib.org.

*The information in this booklet is NOT sponsored by any drug company.

For more information, please visit IMPACT-AFib.org.

IMPACT-AFib

If my doctor prescribes an anticoagulant, how should I take it?

- Take your medication exactly as directed by your doctor
- Take it at the same time each day
- If you forget your medication one day, take a dose as soon as possible on the same day
- Do not take a double dose the following day to “catch up”

Tell your doctor if you are pregnant or plan to become pregnant, are breastfeeding or plan to breastfeed, if you have liver or kidney problems, or are planning to have surgery.

Will anticoagulant medications prevent strokes?

Anticoagulant medications reduce the risk of stroke by 70% in patients with atrial fibrillation.

What about aspirin?

Aspirin is not an effective medication for decreasing the risk of stroke caused by atrial fibrillation.
Dear Provider:

As part of our effort to improve the use of oral anticoagulant medications for stroke prevention in patients with atrial fibrillation (AFib), we would like to introduce you to the IMPACT-AFib initiative. The objective of the IMPACT-AFib initiative is to increase awareness and education among you and your patients. This FDA-sponsored initiative is being conducted by [HEALTH PLAN PLANNING] in collaboration with researchers at Harvard and Duke.

Educational materials were sent to patient(s) who appear to have AFib, have high stroke risk (CHA\textsubscript{DS}\textsubscript{2}-VASc score ≥ 2), and have no record available to us of having filled a prescription for an antiplatelet agent in the past year. Please see the following page for a list of patients who received these materials.

**Facts about AFib**

- Patients with AFib have a five times higher stroke risk relative to patients without AFib (Circulation 2011;123(10):e269–367).
- More than two-thirds of strokes caused by AFib are preventable with anticoagulation (Annals of Internal Medicine 2014;162:1568–1576).
- 50 percent of patients with AFib and high stroke risk have not filled an anticoagulant prescription (Circulation 2014;129(15):1568–1576).

**Common misperceptions about stroke prevention**

**Aspirin is good enough**

- Aspirin reduces stroke by < 20%, if at all, compared with 70% reduction with anticoagulation; therefore, aspirin is not sufficiently effective for stroke prevention.\(^1\)

**Patients with AFib are at greater risk of bleeding than stroke**

- 30% of elderly patients fall in a year, but a patient would need to fall nearly every day before the risk of intracranial bleeding outweighs the benefits of anticoagulants.\(^2\)
- The risk of recurrent GI bleeding averages 1.2% per year but would have to exceed 10% before the risk of GI bleeding outweighs the benefit of anticoagulants.\(^3\)

There are appropriate reasons for patients to not take an anticoagulant, including pregnancy and history of intracranial hemorrhage. A response mailer is enclosed for you to share these reasons, should they exist for your patient(s).

<tr>
<td><strong>Reality:</strong> Risk is about the same for paroxysmal or permanent AFib, indicating need for anticoagulation (Circulation 2014;130:e199–207)</td>
</tr>
<tr>
<td><strong>Myth:</strong> There is no antidote for novel oral anticoagulants</td>
</tr>
<tr>
<td><strong>Reality:</strong> A novel oral anticoagulant (Pradaxa) is available for the novel oral anticoagulant Pradaxa (dalteparin) (N Engl J Med 2015;373:511-20)</td>
</tr>
</tbody>
</table>

---

**Patients with atrial fibrillation (AFib) are at five times higher risk of stroke** (Circulation 2011;123(10):e269–367).

- Two-thirds of strokes in patients with atrial fibrillation are preventable with anticoagulation, as recommended in clinical practice guidelines (Annals of Internal Medicine 2007;146:1261–1272).
- Despite this guideline, at least 50% of patients with a CHA\textsubscript{DS}\textsubscript{2}-VASc score of 2 or higher are not being prescribed an oral anticoagulant (Circulation 2014;129(15):1568–1576).

**You can help change these statistics by**

- Educating all of your patients with AFib about anticoagulant use
- Stopping the use of aspirin as an anticoagulant

For more information, please visit IMPACTAFib.org

---

**Patient name:**

**Date of birth:** _____ / _____ / 19___

**Should not be prescribed an oral anticoagulant because** (please check all that apply)

- He/she is not my patient and/or I am not the prescribing physician
- Patient does not have atrial fibrillation
- Patient already takes an anticoagulant
- An anticoagulant has already been prescribed
- Very high risk of major/life-threatening bleeding
- Unable to tolerate warfarin
- Unable to afford a non-vitamin K oral anticoagulant
- Patient decision after thorough review of risks, benefits, concerns
- Other (please explain):
