Disclaimer

The following report(s) provides findings from an FDA-initiated query using Sentinel. While Sentinel queries may be undertaken to assess potential medical product safety risks, they may also be initiated for various other reasons. Some examples include determining a rate or count of an identified health outcome of interest, examining medical product use, exploring the feasibility of future, more detailed analyses within Sentinel, and seeking to better understand Sentinel capabilities.

Data obtained through Sentinel are intended to complement other types of evidence such as preclinical studies, clinical trials, postmarket studies, and adverse event reports, all of which are used by FDA to inform regulatory decisions regarding medical product safety. The information contained in this report is provided as part of FDA's commitment to place knowledge acquired from Sentinel in the public domain as soon as possible. Any public health actions taken by FDA regarding products involved in Sentinel queries will continue to be communicated through existing channels.

FDA wants to emphasize that the fact that FDA has initiated a query involving a medical product and is reporting findings related to that query does not mean that FDA is suggesting health care practitioners should change their prescribing practices for the medical product or that patients taking the medical product should stop using it. Patients who have questions about the use of an identified medical product should contact their health care practitioners.

The following report contains a description of the request, request specifications, and results from the modular program run(s).

Overview for Request: cder_mp2p_wp065

Request ID: cder_mpl2p_wp065_nsdp_v02

Request Description: In this report we examined the association between use of calcitonin gene-related peptide (CGRP) inhibitors, including (1) small molecule CGRP antagonists and (2) large monoclonal antibodies (mAbs), versus (1) onabotulinum toxin and (2) triptans or dihydroergotamine (DHE) with gastrointestinal (GI) hypomotility-related events and intentional self-harm among patients with migraine in the Sentinel Distributed Database (SDD).

Sentinel Routine Querying Module: Cohort Identification and Descriptive Analysis (CIDA) module and Propensity Score Analysis (PSA) tools, version 14.3.0. This is a Type 2 inferential analysis using the PSA module in the Query Request Package (QRP) documentation.

Data Source: We distributed this query to 6 Sentinel Data Partners (DPs) on February 9, 2026. The study period included data from May 1, 2018, to June 30, 2025. Please see Appendix A for a list of dates of available data for each Data Partner.

Study Design: This study used a retrospective, active comparator, new user cohort design. We identified individuals aged 18 years and older with incident use of the exposure (separate cohorts for small molecule CGRP antagonists and mAbs) and comparator drugs (separate cohorts for onabotulinum toxin, and triptans or DHE), from May 1, 2018, to June 30, 2025, and evaluated the occurrence of GI hypomotility-related events and intentional self-harm. We followed patients from their index dispensing until the earlier of the following: outcome of interest, death, treatment discontinuation or switching to another drug of interest, Data Partner end date, query end date, or disenrollment.

To minimize confounding, we conducted a PSA using 1:1 matching of each exposure cohort to each comparator cohort. In each comparison, we estimated the risk of (1) gastrointestinal hypomotility, constipation, or GI dysmotility with serious complications, (2) constipation, (3) paralytic ileus or intestinal obstruction without hernia, and (4) intentional self-harm.

Exposures and Comparators: We defined the exposure and comparator drugs using National Drug Codes (NDCs) and Healthcare Common Procedure Coding System, Level II (HCPCS) codes. We defined incident use as no prior use of any CGRP inhibitor (gepant or mAb) and the specific comparator drug in the 183 days prior to the treatment date. The date of the first eligible treatment served as the index date. Only the first eligible treatment for each member was included; cohort re-entry was not allowed. Please refer to Appendix B for the list of non-proprietary and proprietary names and Appendix C for HCPCS codes of medical products used to define exposures in this request.

Outcomes of Interest: There were three GI hypomotility-related outcomes: an overall GI hypomotility, constipation, or GI dysmotility with serious complications outcome, comprising any inpatient diagnosis of GI hypomotility, constipation, or paralytic ileus without hernia, and one outcome each for inpatient diagnosis of constipation and paralytic ileus or intestinal obstruction without hernia. An outcome was considered valid only if: during the hospitalization period, there was no diagnosis of colon/rectal cancer, ovarian cancer, malignant neoplasm of the genitourinary organs, Crohn's disease or ulcerative colitis, cancer of small intestine, malignant neoplasm of retroperitoneum/peritoneum, secondary malignant neoplasm of peritoneum, peritoneal adhesions, or epigastric /upper quadrant pain along with intestinal obstruction; and there were no major abdominal surgeries performed during the two week period prior to the hospitalization through the end of hospitalization.

Intentional self-harm was defined as a primary position inpatient psychiatric diagnosis—including depression, personality disorder, mania, adjustment reaction, or unspecified non-psychotic mental disorder—and a concurrent inpatient or emergency department diagnosis of self-harm (poisoning, toxicity of a substance chiefly non-medical in nature; asphyxiation; or open wound to the elbow, wrist, or forearm).

Please see Appendix D for a list of International Classification of Diseases, Tenth Revision, Clinical Modification (ICD-10-CM) diagnosis and International Classification of Diseases Procedure Coding System (ICD-10-PCS) codes used to define the outcomes in this query.

Overview for Request: cder_mp2p_wp065

Cohort Eligibility Criteria: We required members to be enrolled in health plans with medical and drug coverage in the 183 days prior to their index date. A gap in coverage of up to 45 days was allowed and treated as continuous enrollment. We defined incident use as no prior use of any CGRP inhibitor (gepant or mAb) and the specific comparator drug in the 183 days prior to the treatment date.

The following age groups were included in the cohort: 18-29 years, 30-39 years, 40-49 years, 50-59 years, 60+ years. All individuals were required to have evidence of migraine prior to cohort entry. Evidence of migraine was defined as presence of any of the following:

a) ≥2 migraine diagnoses (-183,0), or
b) ≥1 migraine diagnoses (-183,0) and a Triptan dispensing during study period, or
c) ≥1 migraine diagnoses and a neurology encounter (-183, 0; identified using Provider Specialty Codes within the SCDM Provider Table via plus programming)

We excluded individuals with a diagnosis code for cancer (except non-melanoma skin cancer) in the 183 days prior to the index date using ICD-10-CM diagnosis codes. For the GI hypomotility-related outcomes only, we excluded individuals with a diagnosis of certain GI related illnesses, such as Crohn's disease, ulcerative colitis, other colitis, irritable bowel syndrome, and other functional intestinal disorders; or with an inpatient diagnosis of GI hypomotility, constipation, or paralytic ileus without hernia in the 183 days prior to the index date. For the intentional self-harm outcome, we excluded individuals with a diagnosis of traumatic brain injury, an inpatient psychiatric diagnosis in the primary position, or an inpatient or emergency department diagnosis of self-harm.

Please see Appendix E for the list of ICD-10-CM codes, Appendix F for the list of proprietary and non-proprietary names of medical products, and Appendix G for the list of Provider Specialty Codes used to define cohort eligibility in this query.

Follow-up Time: We created CGRP inhibitor and comparator drug exposure episodes based on the number of days of product supplied per dispensing in the pharmacy dispensing data. For the small molecule CGRP antagonists vs. onabotulinum toxin and small molecule CGRP antagonists vs. triptans/DHE comparisons, we bridged together episodes less than or equal to 45 days apart and added 45 days to the end of each episode. For the mAbs vs. onabotulinum toxin and mAbs vs. triptans/DHE comparisons, we bridged together episodes less than or equal to 120 days apart and added 120 days to the end of each episode. Follow-up began on the day of index (Day 0) and continued until the first occurrence of any of the following: 1) an outcome of interest; 2) death; 3) treatment discontinuation or switching (from exposure to comparator drug, or vice versa); 4) disenrollment from medical and/or pharmacy coverage; 5) the end of the data provided by each Data Partner; or 6) the end of the query period.

Baseline Characteristics: Age, sex, race, ethnicity, calendar year, and calendar year-quarter were assessed on the index date. Additionally, we evaluated the following health characteristics in the 183 days prior to the day of index: acute myocardial infarction, glaucoma, cataract, hip/pelvic fracture, Alzheimer's disease, atrial fibrillation, diabetes, hyperlipidemia, heart failure/nonischemic heart disease, hypertension, ischemic heart disease, rheumatoid arthritis/osteoarthritis, stroke/transient ischemic attack, anemia, asthma, benign prostatic hyperplasia, chronic kidney disease, chronic obstructive pulmonary disease/bronchiectasis, osteoporosis, depression/bipolar/other mood disorders, hypothyroidism, pneumonia, Parkinson's disease, non-Alzheimer's dementia, sleep disorder, substance use disorder, anxiety, behavioral disorders, sympathomimetics/alpha-1 agonists, ergot derivatives/methysergide, triptans/ditans, antihypertensives, major surgical procedures, benign prostatic hyperplasia, BMI obese/overweight, other psychological disorders, and medical product use/health care utilization metrics.

Propensity Score Estimation: We included the following characteristics in the propensity score estimation models: age, sex, race year of index, acute myocardial infarction, glaucoma, cataract, hip/pelvic fracture, Alzheimer's disease, atrial fibrillation, diabetes, hyperlipidemia, heart failure/nonischemic heart disease, hypertension, ischemic heart disease, rheumatoid arthritis/osteoarthritis, stroke/transient ischemic attack, anemia, asthma, benign prostatic hyperplasia, chronic kidney disease, chronic obstructive pulmonary disease/bronchiectasis, osteoporosis, depression/bipolar/other mood disorders, hypothyroidism, pneumonia, Parkinson's disease, non-Alzheimer's dementia, sleep disorder, substance use disorder, anxiety, behavioral disorders, sympathomimetics/alpha-1 agonists, ergot derivatives/methysergide, triptans/ditans (only for comparisons with onabotulinum toxin as the comparator drug), antihypertensives, major surgical procedure, benign prostatic hyperplasia, BMI obese/overweight, and other psychological disorders.

Overview for Request: cder_mp2p_wp065
Please see Appendix H for the ICD-10-CM codes, Appendix I for ICD-10-PCS, Current Procedural Terminology, Fourth Edition (CPT-4), and HCPCS codes, and Appendix J for the non-proprietary and proprietary names of medical products used to define baseline characteristics in this query. **Matching:** The matching ratio for the propensity score was 1:1. Drug episodes in the exposed and comparator cohorts were nearest neighbor matched without replacement. The matching caliper was 0.05. Please see Appendices K-N for the specifications of parameters used in this request and Appendix O for the design diagram. **Limitations:** Algorithms used to define exposures and inclusion and exclusion criteria are imperfect; thus, it is possible that there may be misclassification. Therefore, data should be interpreted with these limitations in mind. **Notes:** Please contact the Sentinel Operations Center (info@sentinelsystem.org) for questions and to provide comments/suggestions for future enhancements to this document. Glossary of Terms for Analyses Using
Cohort Identification and Descriptive Analysis (CIDA) Module*

Amount Supplied - number of units (pills, tablets, vials) dispensed. Net amount per NDC per dispensing.
Blackout Period - number of days at the beginning of a treatment episode that events are to be ignored. If an event occurs during the blackout period, the episode is excluded.
Care Setting - type of medical encounter or facility where the exposure, event, or condition code was recorded. Possible care settings include: Inpatient Hospital Stay (IP), Non-Acute Institutional Stay (IS), Emergency Department (ED), Ambulatory Visit (AV), and Other Ambulatory Visit (OA). For laboratory results, possible care settings include: Emergency Department (E), Home (H), Inpatient (I), Outpatient (O), or Unknown or Missing (U). The Care Setting, along with the Principal Diagnosis Indicator (PDX), forms the Care Setting/PDX parameter.

- **Ambulatory Visit (AV) -** includes visits at outpatient clinics, same-day surgeries, urgent care visits, and other same-day ambulatory hospital encounters, but excludes emergency department encounters.
- **Emergency Department (ED) -** includes ED encounters that become inpatient stays (in which case inpatient stays would be a separate encounter). Excludes urgent care visits.
- **Inpatient Hospital Stay (IP) -** includes all inpatient stays, same-day hospital discharges, hospital transfers, and acute hospital care where the discharge is after the admission date.
- **Non-Acute Institutional Stay (IS) -** includes hospice, skilled nursing facility (SNF), rehab center, nursing home, residential, overnight non-hospital dialysis and other non-hospital stays.
- **Other Ambulatory Visit (OA) -** includes other non overnight AV encounters such as hospice visits, home health visits, skilled nursing facility visits, other non-hospital visits, as well as telemedicine, telephone and email consultations.

Charlson/Elixhauser Combined Comorbidity Score - calculated based on comorbidities observed during a requester-defined window around the exposure episode start date (e.g., in the 183 days prior to index).
Code Days - the minimum number of times the diagnosis must be found during the evaluation period in order to fulfill the algorithm to identify the corresponding patient characteristic.
Cohort Definition (drug/exposure) - indicates how the cohort will be defined: 01: Cohort includes only the first valid treatment episode during the query period; 02: Cohort includes all valid treatment episodes during the query period; 03: Cohort includes all valid treatment episodes during the query period until an event occurs.
Computed Start Marketing Date - represents the first observed dispensing date among all valid users within a GROUP (scenario) within each Data Partner site.
Days Supplied - number of days supplied for all dispensings in qualifying treatment episodes.
Eligible Members - number of members eligible for an incident treatment episode (defined by the drug/exposure and event washout periods) with drug and medical coverage during the query period.
Enrollment Gap - number of days allowed between two consecutive enrollment periods without breaking a “continuously enrolled” sequence.
Episodes - treatment episodes; length of episode is determined by days supplied in one dispensing or consecutive dispensings bridged by the episode gap.
Episode Gap - number of days allowed between two (or more) consecutive exposures (dispensings/procedures) to be considered the same treatment episode.
Event Deduplication - specifies how events are counted by the Modular Program (MP) algorithm: 0: Counts all occurrences of a health outcome of interest (HOI) during an exposure episode; 1: de-duplicates occurrences of the same HOI code and code type on the same day; 2: de-duplicates occurrences of the same HOI group on the same day (e.g., de-duplicates at the group level).
Exposure Episode Length - number of days after exposure initiation that is considered "exposed time."
Exposure Extension Period - number of days post treatment period in which the outcomes/events are counted for a treatment episode. Extensions are added after any episode gaps have been bridged.
Lookback Period - number of days wherein a member is required to have evidence of pre-existing condition (diagnosis/procedure/drug dispensing).
Maximum Episode Duration - truncates exposure episodes after a requester-specified number of exposed days. Applied after any gaps are bridged and extension days added to the length of the exposure episode.

Glossary of Terms for Analyses Using
Cohort Identification and Descriptive Analysis (CIDA) Module*

Member-Years - sum of all days of enrollment with medical and drug coverage in the query period preceded by an exposure washout period all divided by 365.25.
Minimum Days Supplied - specifies a minimum number of days in length of the days supplied for the episode to be considered.

Minimum Episode Duration - specifies a minimum number of days in length of the episode for it to be considered. Applied after any gaps are bridged and extension days added to the length of the exposure episode.
Monitoring Period - used to define time periods of interest for both sequential analysis and simple cohort characterization requests.
Principal Diagnosis (PDX) - diagnosis or condition established to be chiefly responsible for admission of the patient to the hospital. 'P' = principal diagnosis, 'S' = secondary diagnosis, 'X' = unspecified diagnosis, '.' = blank. Along with the Care Setting values, forms the Caresetting/PDX parameter.
Query Period - period in which the modular program looks for exposures and outcomes of interest.
Switch Evaluation Step Value - value used to differentiate evaluation step. Each switch pattern can support up to 2 evaluation steps (0 = switch pattern evaluation start; 1 = first evaluation; 2 = second evaluation).
Switch Gap Inclusion Indicator - indicator for whether gaps in treatment episodes that are included in a switch episode will be counted as part of the switch episode duration.
Switch Pattern Cohort Inclusion Date - indicates which date to use for inclusion into the switch pattern cohort of interest as well as optionally as the index date of the treatment episode initiating the switch pattern. Valid options are the product approval date, product marketing date, other requester defined date, or computed start marketing date.
Switch Pattern Cohort Inclusion Strategy - indicates how the switch pattern cohort inclusion date will be used: 01: used only as a switch cohort entry date. First treatment episode dispensing date is used as index for computing time to first switch; 02: used as switch cohort entry date and as initial switch step index date for computing time to first switch.

Treatment Episode Truncation Indicator - indicates whether the exposure episode will be truncated at the occurrence of a requester-specified code.
Washout Period (drug/exposure) - number of days a user is required to have no evidence of prior exposure (drug dispensing/procedure) and continuous drug and medical coverage prior to an incident treatment episode.
Washout Period (event/outcome) - number of days a user is required to have no evidence of a prior event (procedure/diagnosis) and continuous drug and medical coverage prior to an incident treatment episode.
Years at Risk - number of days supplied plus any episode gaps and exposure extension periods all divided by 365.25.

Glossary of Terms for Analyses Using Propensity Score Analysis (PSA) Module*

Covariate - requester defined binary variable to include in the propensity score estimation model (e.g., diabetes, heart failure, etc.) during requester-defined lookback period. Requester may also choose to add any of the following categorical, continuous, or count metrics to the propensity score estimation model:

1. **Age (continuous)**
2. **Sex**
3. **Time period (i.e., monitoring period for sequential analyses)**
4. **Year of exposure**
5. **Comorbidity score**
6. **Medical utilization – number of inpatient stays**
7. **Medical utilization – number of institutional stays**
8. **Medical utilization – number of emergency department visits**
9. **Medical utilization – number of outpatient visits**
10. **Health care utilization – number of other ambulatory encounters (e.g., telemedicine, email consults)**
11. **Drug utilization – number of dispensings**
12. **Drug utilization – number of unique Non-Proprietarys dispensed**
13. **Drug Utilization – number of unique drug classes dispensed**

Covariate Evaluation Window - specified number of days relative to index date to evaluate the occurrence of covariates of interest. Note: members are required to have continuous enrollment during the covariate evaluation window, regardless of the value included in the "Continuous enrollment before exposure" field.

Individual Level Data Return - program may return individual-level, de-identified datasets to the Sentinel Operations Center (SOC). While the datasets contain a single row per patient for each specified analysis, patient identifiers such as a patient ID are not included in the output. Individual-level datasets are returned to the SOC, aggregated, and used to calculate effect estimates via Cox (proportional hazards) regression.

Mahalanobis Distance - provides a measure of balance across all variables while accounting for their correlation.

Matching Caliper - maximum allowed difference in propensity scores between treatment and control patients. Requester may select any caliper (e.g., 0.01, 0.025, and 0.05).

Matching Ratio - patients in exposed and comparator groups are nearest neighbor matched by a 1:1 or 1:n (up to 10) matching ratio.

Matched Conditional and Unconditional Analysis - in a conditional matched analysis, a Cox model, stratified by Data Partner site and matched set, is run on the matched population. This can be done for both the both 1:1 and 1:n matched cohorts. In an unconditional analysis, a Cox model, stratified by Data Partner site only, is run on the matched population. This can be done for the 1:1 matched cohort only.

Propensity Score Stratification - option to stratify propensity scores based on requester-defined percentiles in the unmatched population. In a stratified analysis, a Cox model, stratified by Data Partner site, is run on the stratified population. Note that all patients identified in exposure and comparator cohorts are used in the analysis.

PSM Tool - performs effect estimation by comparing exposure propensity-score matched parallel new user cohorts. Propensity score estimation and matching are conducted within each Sentinel Data Partner site via distributed programming code; data are returned to the SOC, aggregated, and used to calculate effect estimates.

Risk-set Level Data Return - alternative to the patient-level data return approach. In this approach, the PSM tool will produce de-identified, risk-set level datasets instead of or in addition to individual-level output. Whereas each observation in the patient-level datasets represents one patient in the cohort, each observation in the risk set dataset represents one event. Risk sets are created at the Data Partner site, returned to the SOC, aggregated, and used to calculate effect estimates via case-centered logistic regression.

Subgroup Analysis - may be conducted using any requester-defined covariates. Subgroup analyses may be performed in the unmatched and the matched population.

Zero Cell Correction - indicator for whether to screen variables with a zero correction added to each cell in the confounder/outcome 2x2 table. Recommended when the number of exposed outcomes is fewer than 150.
